Preface

Statistical thinking, design and analysis play a crucial role in social life and are useful to society at large. Besides, promoting advanced methodological research is useful to facilitate the dissemination of ideas related to various fields of interest. For this purpose, experts in statistics, data analysis, data mining, statistical methods for decision making, machine learning and related methods come together to understand and analyse phenomena through data.

In line with this objective, the Statistics Group for the Evaluation and Quality of Services (SVQS; www.svqs.it) of the Italian Statistical Society (SIS) has been organizing the Innovation and Society (IeS) conference biennially since 2009, focusing on new developments and ideas in statistics applied to the evaluation and quality of public and private services, attracting national and international statisticians and data scientists. The meeting contributes to spot light on the main statistical approaches and methodologies for the evaluation of public services currently in use in different contexts, as well as to facilitate discussion on the impact of innovative statistical evaluation systems for these services, involving various economic and social policy actors.

The conference “Statistical Methods for Evaluation and Quality: Techniques, Technologies and Trends (T³)” recorded valuable contributions that are reported in this volume. The papers underscore how the growing availability of data has tasked social and economic actors, organizations, and researchers with the management and analysis of large volumes of unstructured and heterogeneous data. In recent years, many tools for both qualitative and quantitative models have been developed to better describe and understand complex systems and their underlying behaviors, and the papers reported in this volume bear witness to this.

Techniques, technologies and trends: the study of data complexity presents the potential to provide analyses with increased frequency and timeliness, accuracy and objectivity, and to define sustainable models. Traditional quantitative methods for capturing socioeconomic data have often shown limitations in their ability to examine underlying systems, and with the three ‘T’ just mentioned, the outlines of future developments are starting to emerge.

The volume reports 127 contributions in the following areas:

- Advanced statistical methods for pattern recognition
- Advances in statistical learning from high-dimensional data
- Data analysis for web sources
- Distance and depth-based statistical learning methods for robust data analysis

- Economics and environment
- Education and labour
- Inequalities in the labour market
- Innovations and challenges in official statistics
- Labour market: trends, perspectives and new challenges
- Methodological and applicative contributions for evaluating sustainable development
- Methodological developments and applications for the assessment of student competencies
- Networks data analysis: new perspectives and applications
- New advanced statistical methods for data science
- Recent advances in statistical learning and data analysis
- Statistical analysis and modeling of environmental pollution data
- Statistical methods and complexity for evaluation in finance
- Statistical methods and composite indicators for healthcare
- Statistical methods and models for land monitoring with spatio-temporal data
- Statistical methods for environmental monitoring and sustainability
- Statistical methods for the analysis of university student choices and academic performance
- Statistical methods for the assessment of transport services and sustainable emissions
- Statistical methods for education and educational services
- Statistics in sports
- Tourism and territory.

The Conference event attracted many contributions as well as numerous Authors, not just from Italy but also from abroad. Over the three-day meeting, the Community has the opportunity to witness some of the state-of-the arts, new trajectories, and methodological challenges in 24 solicited sessions, 7 sessions of free contributes, two round tables - organized by Maurizio Vichi and Matilde Bini respectively - and three keynotes sessions with Ron S. Kennet of Samuel Neaman Institute of Israel, Luigi D'Ambra of Federico II University of Naples, and the former Minister Enrico Giovannini from University of Tor Vergata.

Contents

Plenary Session	1
Befitting Cross Validation with Three Case Studies	2
<i>Kenett R.S.</i>	
Solicited Session SS1 - <i>Statistical analysis and modeling of environmental pollution data</i>	3
Assessing environmental quality by clustering a structural equation model based index: An application to European cities air pollution	4
<i>Bottazzi Schenone M., Grimaccia E. and Vichi M.</i>	
Evaluating the nonlinear association between PM ₁₀ and emergency department visits	10
<i>Bucci A., Sanmarchi F., Santi L., Giostra F., Tubertini E., Rosa S., Nante N. and Golinelli D.</i>	
Estimating spatially varying Gaussian Graphical Models to unveil relationships among pollutants in the Red River Delta in Vietnam	16
<i>Pronello N., Cucco A., Ignaccolo R. and Ippoliti L.</i>	
Solicited Session SS2 - <i>Statistics in sports</i>	22
Clustering Athlete Performances in Track and Field Sports	23
<i>Argiento R., Colombi A., Modotti L. and Montagna S.</i>	
A Cross-Country Analysis of Engagement in Physical Activity and Sport Practice Learnt from Eurobarometer Survey Data	29
<i>Simone R.</i>	
Strong eras in male professional tennis	35
<i>Breznik K., Candila V., Milekhina A. and Restaino M.</i>	
NonParametric Combination method for data analytics in basketball matches	41
<i>Barzizza E., Biasetton N., Ceccato R., Disegna M. and Vezzosi G.</i>	
Solicited Session SS3 - <i>Statistical methods for the analysis of university student choices and academic performance</i>	47
The influence of labor market conditions on students' career disruption: first insights from Italy	48
<i>Usala C., Sulis I. and Porcu M.</i>	
Socio-economic aspects that may affect South-North students' mobility in Italy	53
<i>Genova V.G. and Boscaino G.</i>	
An analysis of student's performance in bachelor's degree	59

<i>La Rocca M., Niglio M. and Restaino M.</i>	
An exploratory strategy for analyzing students' mobility data	65
<i>Primerano I. and Giordano G.</i>	
Solicited Session SS4 - <i>Statistics in football</i>	71
Community Detection in Sport Market Networks: The Case of Italian Professional Football	72
<i>Rondinelli R. and Ievoli R.</i>	
An Original Application to Football of PLS-SEM for the xG Model	78
<i>Cefis M. and Carpita M.</i>	
Performance Assessment of Football Players and Combined Permutation Tests with application to Home-Field Advantage	84
<i>Bonnini S.</i>	
A First Proposal of the Triad Census for Weighted Networks: an Application to Football	90
<i>Rondinelli R. and Palazzo L.</i>	
Solicited Session SS5 - <i>Advances in statistical learning from high-dimensional data</i>	96
PCA approaches for vector functional time series	97
<i>Aguilera A.M., Alonso F.J. and Acal C.</i>	
Conformal Prediction for Functional Kriging Models	102
<i>Diana A., Romano E. and Adzic J.</i>	
Measuring Public-Private Connectedness in Financial Markets	108
<i>Sánchez García J. and Cruz Rambaud S.</i>	
An original approach to anomalies in intertemporal choices through Functional Data Analysis: Theory and application for the study of Hikikomori syndrome	112
<i>Martino R., Ventre V., Cruz Rambaud S. and Maturo F.</i>	
Solicited Session SS6 - <i>Labour market: trends, perspectives and new challenges</i>	118
Enriching Job Vacancy Official Information with Online Job Advertisements: Chances and Limits	119
<i>Lucarelli A. and Righi A.</i>	
Innovation in Management: towards the Open Manager	126
<i>Bruttini P., Gallo M., Mariani P. and Menini T.</i>	
Solicited Session SS7 - <i>Data analysis for web sources</i>	132
Enhancing SMEs default prediction with web-scraped data	133
<i>Crosato L., Domenech J. and Liberati C.</i>	
Web data as enabler for informed decisions in Labour Market	137
<i>Maggioni G.</i>	
The metaverse & luxury fashion brands: strategic communication exercise	141
<i>Forciniti A. and Zavarrone E.</i>	
Increasing the Geographical Granularity of Economic Indicators with Google Trends	147

Domenech J. and Marletta A.

Solicited Session SS8 - <i>Methodological and applicative contributions for evaluating sustainable development</i>	153
Evaluating sustainable development in EU countries through synthetic indicators	154
<i>Alaimo L.S. and Cucci M.</i>	
Naples and tourism sustainability: A survey of citizens' perceptions	160
<i>Aria M., Pagliara F., D'Aniello L. and Della Corte V.</i>	
Modelling inequalities for sustainable development in Italy countries	166
<i>Musella M., Borrata G., Camminatiello I. and Lombardo R.</i>	
Food Security and Sustainability: A Science Mapping Analysis	172
<i>Piscitelli A.</i>	
Solicited Session SS9 - <i>Inequalities in the labour market</i>	178
Skill similarities across Italian regions: an analysis based on the online job advertisements	179
<i>Kahlawi A., Buzzigoli L., Grassini L., Martelli C. and Giambona F.</i>	
Italian Labour Market reform and gender inequalities	185
<i>Marini C. and Nicolardi V.</i>	
Intergenerational transmission of disadvantages in the Italian labour market: evidence from AD-SILC data	191
<i>Busetta A., Fabrizi E., Ragozini G. and Sulis I.</i>	
Solicited Session SS10 - <i>Statistical methods and complexity for evaluation in finance</i>	197
Financial networks resilience and shocks propagation	198
<i>Cerqueti R., Cinelli M., Ferraro G. and Iovanella A.</i>	
How the choice of one parameter impacts the numerical stability of the efficient frontier	204
<i>Fassino C. and Uberti P.</i>	
Dynamic shrinkage for minimum variance combination of forecasts	210
<i>Mattera R.</i>	
Exploring the perception of the gender issue of Italian female entrepreneurs	217
<i>Castellano R., Riccioni J. and Rinaldi A.</i>	
Solicited Session SS11 - <i>Networks data analysis: new perspectives and applications</i>	223
Describing Italian mobility trajectories in higher education	224
<i>Genova V.G., Giordano G., Ragozini G. and Vitale M.P.</i>	
Collaboration networks: methodological issues and updated empirical evidence on Italian statisticians	230
<i>De Stefano D., Fabbrucci Barbagli A.G., Santelli F. and Zaccarin S.</i>	
Mapping Ashtma Complexity with Graph Theory: an Integrative Approach	236
<i>Cucco A., Simpson A., Murray C., Fontanella S. and Custovic A.</i>	
Investigating the patterns of Italian internal mobility: a network analysis at provincial level	242

Sarra A., D'Ingiullo D., Evangelista A., Nissi E., Quaglione D. and Di Battista T.

Solicited Session SS12 - <i>Innovations and challenges in official statistics</i>	248
Formal and informal networks of care for the elderly: regional profiles compared	249
<i>Sicuro L., Tucci D. and Coniglio R.</i>	
Gender Gap: a multidimensional approach	255
<i>Acampora C., Fusco D., Liguori M.A. and Pagliuca M.M.</i>	
Using Whatsapp in Official Statistics: a New tool for managing the Agriculture Census	259
<i>Fabi C.</i>	
Solicited Session SS13 - <i>Statistical methods and composite indicators for healthcare</i>	265
Longitudinal composite indicators to measure the quality of health services	266
<i>Crocetta C., Antonucci L., Cataldo R. and Mazza R.</i>	
Past and Future of Doctor-Patient Communication	272
<i>Tedesco N., Zavarrone E. and Forciniti A.</i>	
Network Analysis approach to customer satisfaction and service quality detection: an application to health-care services	277
<i>Crocetta C., Grassia M.G., Marino M., Mazza R., Simonacci V. and Stavolo A.</i>	
A project evaluation study on multiset Likert scale data	283
<i>Simonacci V., Marino M., Grassia M.G. and Gallo M.</i>	
Solicited Session SS14 - <i>Distance and depth-based statistical learning methods for robust data analysis</i>	289
Robust distance-based predictive models	290
<i>Boj E., Grané A. and Parron D.</i>	
Data depth for mixed-type data through multidimensional scaling. An application to biological age imputation	294
<i>Cascos I., Grané A. and Qian J.</i>	
A compared protocol to improve clustering procedures	298
<i>Grané A., Riani M. and Salini S.</i>	
Robust diagnostics for Linear Mixed Models with the Forward Search . . .	304
<i>Corbellini A., Grossi L. and Laurini F.</i>	
Solicited Session SS15 - <i>Advanced statistical methods for pattern recognition</i>	310
Unsupervised classification of NPLs recovery curves	311
<i>Carleo A. and Rocci R.</i>	
Living alone in Italian municipalities	317
<i>Vellucci P., Benassi F., Naccarato A. and Gallo G.</i>	
Supervised learning from high-dimensional data through dynamic updating of functional classification rules	323

<i>Maturo F., Fortuna F. and Di Battista T.</i>	
Assessing the effectiveness of coordination among public authorities in cohesion expenditure	329
<i>Coco G., Monturano G. and Resce G.</i>	
Solicited Session SS16 - <i>Recent advances in statistical learning and data analysis</i>	335
A Predictive Functional Principal Component Analysis of Well-Being Data	336
<i>Marcis L., Pagliarella M.C. and Salvatore R.</i>	
Detecting the partition in the extended hierarchy of a dendrogram: an application on biomedical data	343
<i>PolICASTRO V., Palazzo L. and VISTOCO D.</i>	
Concordance measure for rankings	350
<i>Bissiri P.G. and Nai Ruscone, M.</i>	
Quadratic discriminant scoring for selecting clustering solutions	355
<i>Coraggio L. and Coretto P.</i>	
Solicited Session SS17 - <i>Statistical methods for education and educational services</i>	361
Association between INVALSI scores and students' mobility in Italy: a preliminary analysis	362
<i>Bacci S., Bertaccini B., Lombardi G. and Tocchioni V.</i>	
Modelling Responses and Response Times: an application to Mathematics INVALSI data	368
<i>Bungaro L., Desiderati R. and Mignani S.</i>	
Latent potential outcomes: An analysis of the effects of programs aimed at improving students' non-cognitive skills	374
<i>Pennoni F., Bartolucci F. and Vittadini G.</i>	
Cognitive Skills and Non Cognitive Skills to Analyze School and Students Performances	380
<i>Vittadini G.</i>	
Solicited Session SS18 - <i>Statistical methods for the assessment of transport services and sustainable emissions</i>	386
Sustainability assessment of urban transport by an LCA comparison on different technologies vehicles	387
<i>Della Ragione L. and Meccariello G.</i>	
Passenger comfort prediction via time-series classification	393
<i>Vanacore A., Pellegrino M.S. and Ciardiello A.</i>	
A statistical model to analyse driving behavior: a case study	399
<i>Rodia G., Sarnacchiaro P. and Acciarino V.</i>	
Aggregating judgments in non negotiable group decisions in transport system	403
<i>Amenta P. and Lucadamo A.</i>	
Solicited Session SS19 - <i>New advanced statistical methods for data science</i>	408

A unified framework for two-dimensional clustering on preference-approvals: an analysis of Eurobarometer data	409
<i>Albano A., Sciandra M. and Plaia A.</i>	
Pandemic Data Quality Modelling: A Bayesian Approach	415
<i>Ferrari L., Manzi G., Micheletti A., Nicolussi F. and Salini S.</i>	
Explainable AI for Peer-to-Peer Credit Risk Management	421
<i>Babaei G., Pagnottoni P. and Do T. T.</i>	
Tackling misclassification in surveys about undeclared work via the EM algorithm	427
<i>Arezzo M.F., Guagnano G. and Vitale D.</i>	
Solicited Session SS20 - <i>Tourism, territory and data analysis</i>	432
Tourism, sustainability, and territorial impact: an input-output analysis . .	433
<i>Garau G. and El Meligi A.K.</i>	
The Impact of Big Data in Tourism	439
<i>Ciuffreda R., Choedon C. and Simonetti B.</i>	
Neural network-based prediction of domestic tourists' length of stay in Italy	443
<i>Antolini F. and Cesarini S.</i>	
The management of cultural heritage in contexts of undertourism: a model for assessing the economic sustainability of public-private partnerships	450
<i>Calabrò F.</i>	
Solicited Session SS21 - <i>Statistical methods and models for land monitoring with spatio-temporal data</i>	457
Geo-referenced data and complex networks for measuring road accident risk	458
<i>Cantaluppi G., Clemente C., Della Corte F. and Zappa D.</i>	
A comparison of geospatial models for car crash risk	464
<i>Cantaluppi G., Giardino G. and Zappa D.</i>	
Geostatistical modelling of livestock-related PM _{2.5} pollution and scenario analysis for policymakers - Work in progress	470
<i>Fassò A., Rodeschini J., Fusta Moro A. and Finazzi F.</i>	
Functional clustering methods for space-time big data from mobile phone networks	476
<i>Perazzini S., Metulini R. and Carpita M.</i>	
Solicited Session SS22 - <i>Methodological developments and applica- tions for the assessment of student competencies</i>	483
Modeling the main drivers of mathematical literacy of school-leaving stu- dents. Some evidence from the Invalsi tests	484
<i>Davino C., Palumbo F., Romano R. and Vistocco D.</i>	
Educational Data Mining: clustering students' performance over time . . .	490
<i>Taraborrelli G. and Farnè M.</i>	
The nexus of cultural capital with participation in early childhood education	496
<i>Ripamonti E.</i>	
High- and Low-Performing students and future career: a gender and social issue	502
<i>Falzetti P. and Ricci R.</i>	

Solicited Session SS23 - <i>Statistical methods for environmental monitoring and sustainability</i>	508
Clustering spatial data through optimal transports	509
<i>Balzanella A. and Verde R.</i>	
New interpretative insights for environmental air quality by means of FDA	514
<i>Terzi S., Naccarato A. and Fortuna F.</i>	
A Bayesian State-Space Model to Mitigate Unmeasured Confounding . . .	520
<i>Zaccardi C., Valentini P. and Ippoliti L.</i>	
Mining social media data for damage assessment in environmental disasters	526
<i>del Gobbo E., Cafarelli B., Ippoliti L. and Fontanella L.</i>	
Solicited Session SS24 - <i>Satisfaction and behavior in tourism</i>	531
The evaluation of the hotel stay through a new development of correspondence analysis coping with ordinal variables	532
<i>D'Ambra A. and Amenta P.</i>	
Assessing the role of knowledge and authenticity in the formation of attendee loyalty at cultural festivals	536
<i>Rivetti F., Lucadamo A. and Rossi C.</i>	
Residents' Opinions and Perceptions of Tourism Development in the Historic City of Matera	542
<i>Sarnacchiaro P., Di Gennaro R. and Di Taranto E.</i>

Risk Management and Future Scenarios. A proposal based on a mixed-method approach

Gestione del rischio e scenari futuri? Una proposta basata su un approccio quali-quantitativo

Simone Di Zio, Mario Bolzan, Marco Marozzi and Manuela Scioni

Abstract The rapid changes in society and the risks related to disastrous and unexpected events increasingly represent a challenge to scientists. The aim of this paper is to provide a comprehensive framework to effectively manage emerging and future risks by incorporating the strategic foresight approach, which starts from a future scenario planning method and includes quali-quantitative tools, in a consequential chain of techniques, where the output of one step is the input of the next. The framework is based on a six-step future risk management process, including assessment (comprising identification, analysis and evaluation), treatment and communication. A research project on future scenarios for contemporary families will serve as a representative example of this framework.

Abstract *I rapidi cambiamenti a cui la società è soggetta e i rischi legati ad eventi inattesi e disastrosi rappresentano una sfida crescente per gli scienziati. Lo scopo di questo lavoro è quello di fornire un quadro metodologico per la gestione dei rischi emergenti e futuri, il cui punto di partenza è un metodo di pianificazione degli scenari futuri e che include strumenti quali-quantitativi organizzati in una successione. L'intero processo di gestione è suddiviso in sei fasi che comprendono la gestione (identificazione, analisi e valutazione), il trattamento e la comunicazione dei rischi.*

Un progetto di ricerca sugli scenari futuri per le famiglie contemporanee viene utilizzato come esempio rappresentativo della metodologia proposta.

Key words: Risk Analysis, Risk Assessment, Mixed Methods, Futures Scenarios, Family

1 Introduction

The evident and rapid changes in society and the risks of disastrous events that manifest themselves in unforeseen and unexpected ways increasingly represent a challenge to scientists who intend to continue to be credible when advancing hypotheses in response to the needs of contemporary society. The example of the pandemic produced by Covid-19 - like the events related to climate change - is still in everyone's eyes and it represents the event that has caught the governments of nations as well as the scientific community unprepared. It then raises the spontaneous question: are traditional research approaches still convincing and exhaustive to face risks?

Often, when a new approach that goes off the beaten track of science is proposed, it is viewed with suspicion and, sometimes, with hostility. We do not want to say that everything new is better than the old, but this is what happened to a dear colleague of ours, who unfortunately passed away. More than 20 years ago, Antonio Pacinelli began to propose the themes of futures studies and scenarios, with the intention of offering advanced scientific solutions to complex problems, encountering doubts and perplexities in the scientific community of statisticians. Today, this scientific area is spreading more and more, and the skepticism of many has turned - at least - into curiosity. The contribution of this paper fits into this groove traced by Pacinelli and which we, and other statisticians, are starting to follow, with great enthusiasm and enormous gratitude to dear Antonio. With his tenacity, he taught many the courage of commitment to the service of the best research.

The advancement of new and not always tested proposals is required also to address interactions between cognitive problems of different epistemological natures, whether qualitative or quantitative. We propose a proactive and forward-looking approach to risk management, which can be defined as future risk management.

The aim of this paper is to provide a comprehensive framework to effectively manage emerging and future risks by incorporating the strategic foresight approach, which starts from a future scenario planning method and includes quali-quantitative tools like Delphi surveys and focus groups, composite indicators, fuzzy clustering, cross-impact analysis and multi-criteria methods, in a consequential chain of techniques, where the output of one step is the input of the next. The framework is based on a six-step future risk management process, including assessment (which in turn can be decomposable in three phases: identification, analysis and evaluation), treatment and communication of emerging and future risks.

A research project on future scenarios for contemporary families will serve as a representative example of this framework [1, 2].

2 A new approach to risk management using Delphi-based scenario planning

Since the 1970s, studies of risk have become a very large and active interdisciplinary field of research and, in recent years, also embraced statistics and Futures Studies [3, 4]. Regardless of how it is defined and/or measured, risk is a characteristic of the future. Indeed, according to Fischhoff et al. [5], the most significant aspect of risk is the attribution of consequences to future events.

An important step in understanding the problem of risk analysis, risk evaluation, and decision-making is the distinction between risk assessment and risk management. The first regards the qualitative and/or quantitative estimation of risk, while the second (at a macro level) includes plans, actions, strategies or policies set to reduce the probability and/or impact of risks [6].

Scenarios can be defined in various ways and are used in different disciplines. In the methodological corpus of Futures Studies (FS), and in its application counterpart - known as Strategic Foresight - scenarios are recognized as “a set of hypothetical events set in the future constructed to clarify a possible chain of causal events as well as their decision points” [7]. They do not intend to predict a static future but are “hypothetical sequences of events constructed in order to focus attention on causal processes and decision points” [7] useful to reduce risk. According to the International Organization for Standardization [8], scenarios are strongly applicable in the steps of risk identification and risk analysis. Since we propose a complete future risk management process, starting from a specific scenario planning approach called Delphi-based Scenario, what we are presenting in this paper is entirely distinct.

As already mentioned, an emerging and future risk management process includes different steps that aim at identifying, analyzing, evaluating, treating and communicating potential risks that may arise from new or mutating sources.

As we will see in the following we propose a matching between the phases of future scenario planning following the approach proposed by [9] and the phases of the risk management process suggested by the ISO [8]. Within each of these phases, we propose one or more techniques for risk framing, risk assessment and risk treatment. In particular, we suggest a combination of techniques organized in a specific sequence [2] in an overall approach that fully falls within the logic of mixed methods [10].

In the following, we describe the phases of this approach and to this end, the title of each paragraph contains the risk management phase alongside the corresponding scenario planning phase.

1. Scope and context - Framing.

According to the ISO, the purpose and scope of the risk assessment should be established, with a clear description of what is included, and what is excluded. The framing phase of Delphi-based scenario also involves developing a set of questions/hypotheses that the scenarios will seek to answer, and this is important in helping to ensure that the developed scenarios are relevant and helpful for the intended purpose.

2. Risk identification - Scanning.

Identifying risk enables explicitly taking into account uncertainty, by considering all its possible sources and identifying and describing risks. This step can involve different techniques, such as brainstorming sessions, focus groups, surveys, Delphi with stakeholders or a literature review. Most recently, new techniques are also being used, among which we mention text analytics, an approach that uses natural language processing (NLP) to transform free unstructured text into structured data [11], and so it turns out to be very useful in the rapid scanning of large quantities of documents for identifying potential and emerging risks.

3. Risk analysis - Forecasting.

Risk analysis allows an understanding of the nature of risk and to assess consequences, risk likelihood, as well as interactions and dependencies between risks, in order to evaluate the possible impacts. According to ISO, in this phase, it is important to analyze the type, magnitude and timing of consequences and the importance of the changing of consequences over time, so the time variable must be taken into account. The Delphi technique is particularly suited in this step.

4. Risk evaluation – Visioning.

Risk evaluation requires comparing the outputs of the risk analysis with the established risk criteria to move towards the next phase which requires concrete actions [8].

In the Visioning phase of scenario planning the experts and/or stakeholders are asked to consider the implications of the various scenarios that were developed in the preceding forecasting phase and asked to evaluate how different scenarios would impact the context under study and the long-term consequences of each scenario. Among the many techniques, Cross Impact Analysis [12] - a semi-quantitative method suitable for short/medium time horizons - is very useful in this stage to evaluate changes in the probability of the occurrence of a given set of events consequent on the actual occurrence of other events/scenarios.

5. Risk treatment – Planning & Acting.

The aim of this phase is to select concrete actions for the mitigation of the impact of emerging and future risks, the definition of preventative care and/or contingency plans, based on the evaluation made in the previous steps. The Planning phase of the Delphi-based scenario planning may be fully suited to achieve the same purposes because consists of developing a plan of action starting from the developed scenarios. This implies identifying specific strategies, policies, and resources that will be needed to implement the plan. In the Acting phase, actions to give concreteness to the previous planning phase must be defined. About the techniques usable in this phase, we find Multi-Criteria Analysis (MCA), a family of techniques for comparing options in a way that makes trade-offs explicit. In particular, we suggest the Analytic Hierarchy Process - AHP [13] - which does not require particular starting data, can be used for any time horizon.

3 The “Tomorrow in the family” Project

The “Tomorrow in the family” project is a four-year research project carried out to figure out the possible dynamics that will affect family life in the near future [1], with a time horizon of ten years and reference to the North East of Italy. The main idea underlying this project was to build some plausible scenarios to stimulate the reflection on which risks the family will have to face in the near future.

Framing & Scanning: Scope and Context & Risk Identification. Through a series of focus groups, a set of 41 items including the key elements have been identified as fundamental in the future development of the family system. Each item can lead to the identification of both risks and opportunities.

Forecasting: Risk Analysis. The next step was to apply a Delphi Survey with a panel of 32 experts. In order to investigate the future development of each item, the experts were asked to provide two assessments using an ordinal scale of 0-100, the first concerning Evolution, that is the spread of the phenomenon indicated in the item, and the second regarding Relevance (or importance). Both evaluations were merged by proposing a robust method to combine experts’ opinions [2].

Visioning: Risk Evaluation. The Delphi and the robust ranking procedure produced four scenarios, whose titles are: 1. Parents and society: even more for the family; 2. At home to feel like a family; 3. There is no family without... the internet; 4. Politics and volunteering meet the family. We refer to [2] for the complete description of the scenarios. These scenarios were submitted for evaluation to a further panel of experts, which evaluated their plausibility and consistency. In the project, an application of the Cross-Impact analysis [12] is in progress, as well. It is about assessing the impact that certain policy actions can have on the four scenarios. Policies tested are: a) Increase the accessibility and availability of family counselling services in situations of family difficulties of different types; b) Improve public welfare (e.g., availability of services to the person, the elderly, children); c) Promote a cultural change in family members through training actions (to promote awareness of shared responsibilities); d) Improve corporate welfare to support workers with dependent children and elderly.

Planning and Acting: Risk Treatment. Eight intervention proposals to support the family members, particularly women, in the context of one scenario (concerning, in particular, the future of the mother and her role within the family) were compared according to two different criteria: “Feasibility” and “Efficacy”, using the Analytic Hierarchy Process (AHP).

4 Conclusions

The proposal of this paper starts from the re-reading of the risk management process as described by the International Standard [8] combined with the contribution of the futures studies approach conducted, in particular, by using the Delphi-based scenario development.

In our proposal, we tried to highlight the possibility of building a matching between the two approaches, in order to achieve new and useful synergies, both from a methodological and epistemological point of view.

At the conclusion of the work, some indications or proposals emerge which seek to go beyond the classic dichotomous approach “quantitative or qualitative”, trying instead to follow a proactive approach based on the so-called mixed methods approach.

The research conducted on the “Tomorrow in the family” project represents a specific application in the process of evaluating actions in support of a specific scenario, in order to support public decisions to mitigate and/or prevent the effects of the risks that have emerged from that scenario.
